Mini-project #1: Geo

Visualization 1

How do the countries compare in terms of how much they receive and donate from other countries?
Are there countries that donate much more than they receive or receive much more than they donate?

The countries that receive significantly more aid than they give are India, Thailand, and Brazil. The countries that give significantly more aid than they receive are the United States of America, Japan, and Germany.

There are a few countries in the center as well, that give and receive roughly the same amount, causing them to have either no visible bar or a very small bar. A few of these are Portugal, Iceland, Liechtenstein, and Monaco.

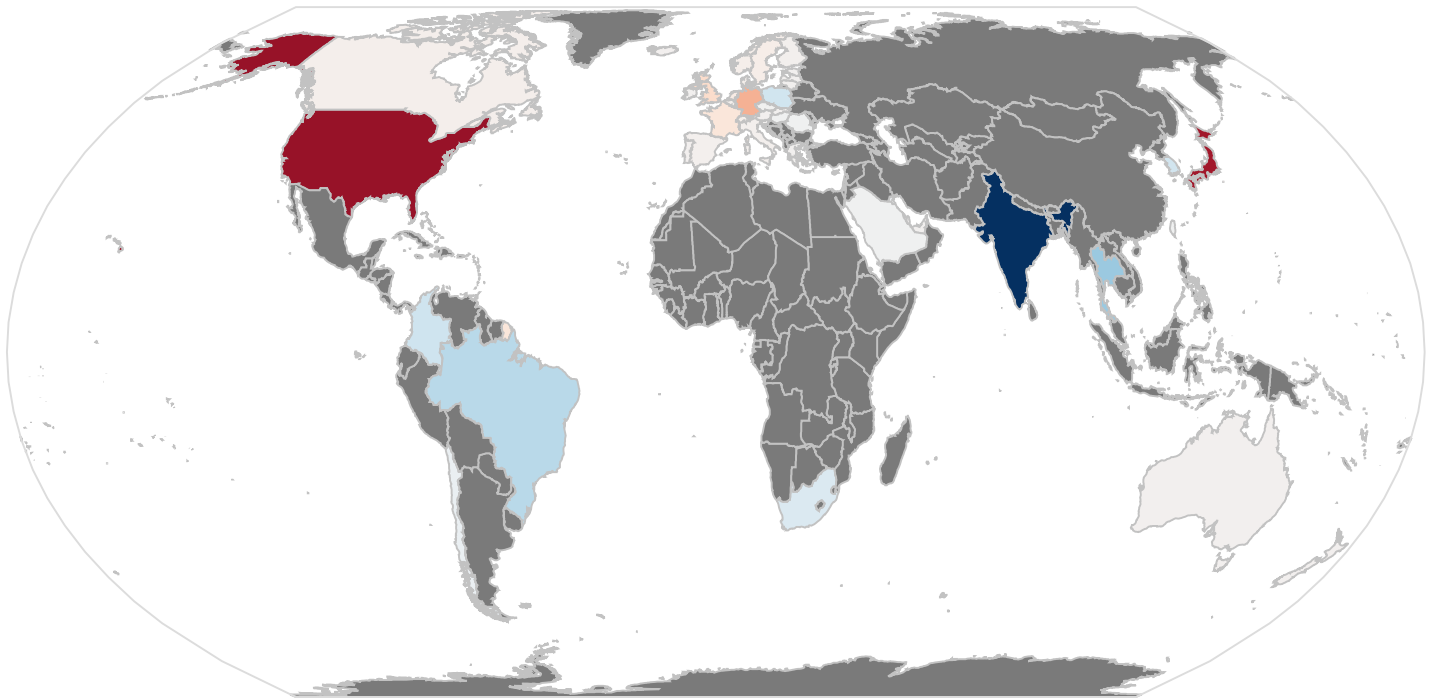

Visualization 2

Do the countries that mostly receive or mostly donate tend to cluster around specific geographical areas of the world?

Are there neighboring countries that have radically different patterns in terms of how much they receive vs. how much they donate?

Net Donation \$

-100G -50G 0G 50G 100G

As can be seen on the map, the majority of countries that are near each other fall into similar donation habits. The largest differences would be between the United States and Canada, and Korea and Japan. The US and Canada are both red, meaning they donate more than they receive, but Canada is a much lighter red. For Korea and Japan, Korea is a light blue and Japan is a dark red, so Korea receives slightly more aid, and Japan gives significantly more donations.

A small difference can be seen in Europe as well. Poland is blue, it receives more aid than it gives, and Germany is red. Both are light compared to countries like the US and India, but they're darker than the surrounding European countries.

Looking at South America, the countries there are mostly blue. The only exception is French Guiana, which is being considered as part of France anyway, and it's a very light red.
